Description

The **Database plugin** allows you to define and manage **your own database tables**. The definition of the record structure is made quickly and easily thanks to the Device Configurator designer. Each table can contains as many fields as you want. Each field owns appropriate properties and user profiles for the authorization to a great deal of operations such as inserting, editing, displaying and deleting records. It is also possible to create automatically SQL statements to be executed on the server, usually MySQL, for the creation of the tables themselves. **Over 25 field types** are supported, including **string fields, numeric fields, date, time, e-mail, images, documents, barcode, GPS, telephone, signature and more**.

The interfaces logic creation are multiple and all simply configurable.
